

GLOBAL SALES & FINANCIAL PERFORMANCE DATASET

Using Microsoft Power BI Project Report

Submitted By Name: AM.Jeyashri

Roll no: E25FA016

Course: B.com(Fintech&AI), 2nd year

Tool Used: Microsoft Power BI Desktop

1. Introduction

For this project, I created an interactive Global **Sales & financial performance Dashboard in Power BI** using the given sales dataset. My main aim was to convert the raw data into a simple visual dashboard that could help me understand sales, cost, profit, quantity, product categories, regions, employees, and monthly performance.

I started by importing the dataset into Power BI and creating the required measures using DAX. After that, I created different visualizations such as KPI cards, line charts, column charts, bar charts, donut charts, tables, and slicers.

I also used **tooltips** in the dashboard so that when I move the cursor over a visual, I can see additional information about the selected data point. This helped me understand the figures in more detail without overcrowding the main dashboard.

2. Objectives

Going into this project, I set out with the following objectives:

- Analyse the overall **sales, cost, profit, quantity, and order count**.
- Create an interactive dashboard using Power BI.
- Compare sales performance across different **product categories**.
- Analyse sales performance across different **regions**.
- Track sales performance across different **months**.
- Compare profit generated by different **employees**.
- Create a product-wise summary of sales, profit, and quantity.
- Use slicers and tooltips to make the dashboard easier to explore.

3. Data Components and Measures Used

After importing the dataset, I created different DAX measures to calculate the main business figures required for the dashboard.

3.1 Total Sales

I created the **TOTAL SALES** measure to calculate the overall sales value from the dataset. I used this measure in the KPI card and several charts to compare sales performance.

3.2 Total Cost

I created the **TOTAL COST** measure to understand the total cost associated with the sales transactions. I displayed this as a KPI card to compare the cost against sales.

3.3 Total Profit

I created the **TOTAL PROFIT** measure to understand the overall profit generated. I used this measure in the KPI card and employee-wise profit chart.

3.4 Total Quantity

I created the **TOTAL QUANTITY** measure to calculate the total quantity sold. This helped me understand sales volume along with the monetary values.

3.5 Order Count

I created the **ORDER COUNT** measure to identify the total number of orders in the dataset. I displayed this as a KPI card to understand the transaction volume.

3.6 Average Sales

I also used the **AVERAGE SALES** measure in the KPI section to understand the average sales value rather than looking only at the total.

4. KPI Cards

First, I created **five KPI cards** to provide a quick summary of the most important figures.

KPI Card	Measure Used	Purpose
Total Sales	TOTAL SALES	Shows overall sales value
Total Cost	TOTAL COST	Shows overall cost
Total Profit	TOTAL PROFIT	Shows overall profit
Order Count	ORDER COUNT	Shows total number of orders
Average Sales	AVERAGE SALES	Shows average sales value

These cards helped me understand the overall performance before moving into detailed visual analysis.

5. Visualizations Used

5.1 Monthly Sales Trend

I created a **Line Chart** using **MonthName** on the axis and **TOTAL SALES** as the value.

This visual helped me track how sales changed from month to month and identify periods with relatively higher or lower sales.

Tooltip Used

When I hover over a month, the tooltip displays the corresponding **Total Sales** value, allowing me to see the exact figure behind the point in the chart.

5.2 Sales by Product Category

I created a **Clustered Column Chart** using **Category** and **TOTAL SALES**.

I used this chart to compare the sales generated by different product categories and identify which categories contributed more to overall sales.

Tooltip Used

The tooltip helps me see the **exact Total Sales** for the selected category when I hover over each column.

5.3 Profit by Employee

I created a **Clustered Bar Chart** using **Employee Name** and **TOTAL PROFIT**.

This visual helped me compare the profit generated by different employees and understand the difference in their contribution to overall profitability.

Tooltip Used

When I hover over an employee's bar, the tooltip shows the corresponding **Total Profit** value.

5.4 Sales by Region

I created a **Donut Chart** using **Region** and **TOTAL SALES**.

I used this visual to understand how total sales were distributed across different geographical regions.

The donut chart made it easier for me to identify which region contributed a larger share of total sales.

Tooltip Used

The tooltip displays the **Region** and its corresponding **Total Sales**, allowing me to see the numerical value behind each section.

5.5 Product-wise Sales, Profit and Quantity

I created a **Table** containing:

- Product Name
- Total Sales
- Total Profit
- Total Quantity

I sorted the table based on **Total Profit**, which helped me identify the products generating higher profitability.

Tooltip / Detailed Information

The table itself provides the numerical values for sales, profit, and quantity, allowing me to compare individual products in more detail.

6. Slicers and Interactivity

To make the dashboard interactive, I added three slicers:

6.1 Year Slicer

I used the **Year** field from the Date table so that I could analyse the dashboard for a particular year.

6.2 Category Slicer

I added a **Category** slicer to analyse the performance of a particular product category.

6.3 Region Slicer

I added a **Region** slicer to analyse sales performance for a selected geographical region.

These slicers are connected to the dashboard visuals. When I select a particular year, category, or region, the related KPI cards and charts update automatically.

7. Tooltips Used in the Dashboard

I used tooltips as an additional layer of information in the dashboard. Instead of adding too many numbers directly onto the charts, I used the tooltip feature to display the relevant numerical value when I hover over a data point.

The main tooltip information included:

Visual	Information Viewed Through Tooltip
Monthly Sales Trend	Month + Total Sales
Sales by Category	Category + Total Sales
Profit by Employee	Employee Name + Total Profit
Sales by Region	Region + Total Sales
Product Table	Product + Sales + Profit + Quantity

This helped me keep the dashboard clean while still allowing detailed numerical analysis.

8. Key Findings

1. I found that the dashboard provides **5 major KPI measures: Total Sales, Total Cost, Total Profit, Order Count, and Average Sales**.
2. I observed that monthly sales showed **different levels of performance across the available months**, which I identified using the line chart.
3. I found that **sales contribution varies across product categories**, with some categories generating higher total sales than others.
4. I observed that **profit contribution differs between employees**, which I analysed using the employee-wise profit chart.
5. I found that sales are distributed across **different geographical regions**, with some regions contributing a larger share of total sales.
6. I observed that the product table provides **three important numerical measures: Total Sales, Total Profit, and Total Quantity** for individual products.
7. I used **Year, Category, and Region slicers** to filter the dashboard and analyse the data from different perspectives.
8. I found that **tooltips made it easier to view exact numerical values** without adding too much information directly onto the charts.

9. Conclusion

Through this project, I learned how to build an interactive sales dashboard in Power BI by converting raw data into meaningful visual information. I created **5 KPI cards, multiple charts, a detailed product table, and 3 slicers** to analyse the dataset from different perspectives.

I also gained practical experience in creating and using DAX measures such as **Total Sales, Total Cost, Total Profit, Total Quantity, Order Count, and Average Sales**. The different charts helped me analyse monthly sales, category-wise sales, employee-wise profit, and region-wise sales.

The use of **tooltips** was also useful because it allowed me to view the exact numerical values behind the visuals without making the dashboard look crowded. Overall, this project helped me understand how Power BI can be used not only for data visualisation but also for interactive business analysis and decision-making.
